U.S.S.N. 10/783,668

## **CLAIMS:**

- 1. (Original) A machine for removing debris from battery cells, comprising:
  - a. a means for holding a battery cell; and
  - b. a cutting means comprising at least one blade;
    wherein when a battery cell is inserted into the means for holding a battery cell, and
    the cutting means is actuated, the at least one blade passes across at least one surface
    of the battery cell.
- (Original) The machine of claim 1, wherein the cutting means further comprises a leveling means.
- (Original) The machine of claim 2, wherein when a battery cell is inserted into the means for holding a battery cell, the amount of insertion is limited by the leveling means.
- (Original) The machine of claim 1, further comprising a magnet mounted below the cutting means.
- (Original) The machine of claim 1, wherein the means for holding a battery cell comprises a fixed block and a moveable belt.
  - 6. (Original) The machine of claim 5, wherein the moveable belt is spring loaded against the fixed block.
  - (Original) The machine of claim 1, further comprising a sliding member coupled to the cutting means, wherein the sliding member is mounted on rails.
  - 8. (Original) The machine of claim 7, wherein the sliding member is coupled to a lever.
  - (Original) The machine of claim 8, wherein lever is rotatably connected to the sliding member by way of a gear assembly.
  - 10. (Original) The machine of claim 7, further comprising a threaded member coupled to the sliding member, wherein the threaded member passes through a fixed adjustment stop.

## U.S.S.N. 10/783,668

- 11. (Original) The machine of claim 10, further comprising a threaded stop disposed about the threaded member such that the fixed adjustment stop is disposed between the sliding member and the threaded stop.
- 12. (Original) The machine of claim 11, wherein travel of the cutting means is adjustable by twisting the threaded stop about the threaded member.
- 13. (Original) The machine of claim 1, wherein the cutting means is electrically isolated from the means for holding a battery cell.
- 14. (Original) A method of removing debris from a battery cell, the method comprising the steps of:
  - a. providing the machine of claim 1;
  - b. opening the means for holding a battery cell;
  - c. inserting a battery cell into the means of holding a battery cell until one end of the battery cell touches the leveling means;
  - d. closing the means for holding a battery cell; and
  - e. actuating the cutting means, thereby causing the cutting means to pass along the one end of the battery cell.
- 15. (Original) A machine for removing debris from a battery cell, comprising;
  - a. a base member;
  - a fixed block coupled to the base member, wherein the fixed block includes a recess for holding the battery cell;
  - a moveable belt that is spring loaded against the fixed block such that the recess
     and the moveable belt form a closed loop; and
  - d. a moveable cutting means comprising at least one blade;
    wherein when the moveable cutting means is moving, the at least one blade travels
    parallel to the top surface of the leveling means.

U.S.S.N. 10/783,668

- 16. (Original) The machine of claim 15, wherein the moveable cutting means further comprises a leveling means.
- 17. (Original) The machine of claim 15, further comprising a magnet disposed below the cutting means.
- 18. The machine of claim 15, wherein the cutting means is electrically isolated from the fixed block and the moveable belt.
